I was always curious why women tend to learn and recuperate after strokes better, and faster than men. The reason is a certain band, located in the forehead region, that connects the left side of the brain to the right side. It is larger in women than in men and enables women to learn faster when in rehabilitation.

The neuroscience of sex differences is the study of characteristics that separate the male and female brain. Psychological sex differences are thought by some to reflect the interaction of genes, hormones, and social learning on brain development throughout the lifespan. Some evidence from brain morphology and function studies indicates that male and female brains cannot always be assumed to be identical from either a structural or functional perspective, and some brain structures are sexually d
