The evaporative emission control (EVAP) system captures gasoline fumes and other emissions. If the fuel tank was sealed tight; the fuel pump could create enough negative pressure to collapse it. So, On older (EVAP) systems, the tank is vented by a spring-loaded valve inside the gas cap.

Input voltage, typically from the ignition circuit, is modified by the fuel sender.

The fuel float contacts run on a potentiometer, or variable resistor, whose resistance changes depending on float level, effecting a change in output voltage.

Isn't Working

A fuel leak is when gasoline leaks from the gas tank of the vehicle. Underneath the car will be a spot of fuel on the pavement, along with the strong smell of gasoline. A fuel leak should not be ignored, so as soon as you notice these signs, it is time to make an appointment with a mechanic right away.
