One shell to rule them all, one shell to find them, one shell to bring them all and in the same distro bind them. Command line is one of the many strengths of Linux based systems. Why is it a strength? There is no one answer; there are many answers.

## **How to Use the Linux Command Line: Basics of CLI - Linux.com**

Linux shells maintain a history of the commands issued by a user. You can display the list of commands that you've entered before with the history command. This is a neat shell feature because it enables you to repeat some complex commands you've already entered. By default, the last 500 commands are shown.

## **The Linux Command Line**

If you do not specify a filesystem, the system will analyze your fstab file (/etc/fstab) for the devices to scan. You will need to run the command either as root user or use it with sudo. You can use fdisk or df command to list the hard drive in Linux. This way, you can specify which device to be checked with fsck command.

## **How to Use Fdisk Command in Linux (to Repair File System)**

We'll call the command "fd," but in the examples, we'll use the Ubuntu "fdisk." On other Linux distributions, you can type "fd" instead of "fdisk" to save a few keystrokes. Simple Searches with fd. If you use fd with no command-line options, it behaves a little like ls, except it lists files in subdirectories by default.

## **How to Use the fd Command on Linux**

We also should point out that while Windows and DOS use the well known back-slash '\ ' in the full path address, Linux differentiates by using the forward-slash '/'. This explains why we use the command 'cd /etc/init.d' and not 'cd \etc\init.d' as most Windows users would expect.
