The diff of the MX-5 Miata is bolted to the rear subframe with two large nuts and rubber mounting bushes. The drive-shaft and half shafts need to be removed to get the differential out of the car, and often the rear section of the exhaust needs to be removed to allow enough room to lower the diff. On the later cars, there was a variety of underbody bracing which may also get in the way.

This guide is a very beginners guide on what to look for, options to choose from and where to start looking. This is by no means a complete guide but gives people that were in the same position as me a year ago the chance to get a quick insight into the different aspects of how to turbo their Mx5's.

Take note, the swaybar mounting point on the NA/NB MX-5 is prone to cracking and failure under heavy use, consider something like the Racing Beat Sway Bar Brace Kit to prevent this. Another item for performance, a well designed 'cold-air-intake' will help with top end... often at the sacrifice of a little mid-low end torque, but for a track car which is always revving at 5000rpm+ that's not an issue.

Cornering and spirited driving can create chassis flex due to extra loads on your suspension, which can result in diminished traction and reduced steering feel. Our Front Strut Tower Brace adds rigidity to your MX-5, which reduces chassis flex, and helps ensure that your tires are kept on the road to deliver maximum traction and steering precision.
